Introduction to the Technical Specifications Manual

This manual provides information, tools, and recommended configuration details to help technology staff in Consortium states prepare computers to be used with the Smarter Balanced Pilot Test administration.

Manual Content

This document provides technical information in seven sections, as follows.

- **Section I, Internet and Network Requirements**, provides information about bandwidth, wireless networking, network configuration, and diagnostic tools.
- **Section II, Hardware Requirements**, contains information regarding supported tablets, keyboards, headphones, and printers.
- **Section III, Software Requirements**, provides information about pop-up blockers, installing the Verdana font on Linux machines, and how to disable the Fast User Switching feature in Windows-based computers.
- **Section IV, Text-to-Braille**, contains hardware and software requirements for student and Test Administrator computers.
- **Section V, Secure Browser Installation**, provides instructions for downloading and installing the secure browser on each supported operating system, and options for pushing the secure browser out to student computers over a school network.
- **Section VI, Mobile Secure Browsers**, provides instructions for downloading and installing the secure mobile browsers on supported iPad and Android tablets, including how to enable Guided Access on iPads and the secure browser keyboard on Android tablets.
- **Section VII, Chromebooks**, provides instructions for accessing the secure test environment using Chromebooks.
- **Section VIII, Text-to-Speech and Voice Packs**, contains instructions for ensuring that text-to-speech is enabled on supported operating systems.
- The **Appendix** contains a checklist that technology staff at schools can use to ensure student computers are correctly set up for testing.

Other Resources

User guides for systems provided by AIR are posted to the Smarter Balanced portal in the Secure Pilot Test Resources section.

Additional Support

If you need information that is not provided in this manual or on the Smarter Balanced Assessment Consortium website ([www.smarterbalanced.org](http://www.smarterbalanced.org)), contact the Smarter Balanced Help Desk at the American Institutes for Research. Contact information is listed on the User Support page at the end of this document.
Section I. Internet and Network Requirements

A stable, high-speed (wired or wireless) Internet connection is required for online testing. The response time for each assessment depends on the reliability and speed of your school’s Internet network.

If your Internet connection goes down, students will need to complete their tests at a later time or on another day. Any answers they have already submitted will be saved, and students will resume their tests where they left off. (Students will return to the first unanswered item in the test.)

For the online testing applications to work properly, you may need to verify your network settings. If you are not sure whether your network is properly configured or you have questions, contact your network administrator or technology specialist to find the right contact person in your area. You may also contact the AIR Help Desk.

Network configuration settings should include the following:

- Content filters, firewalls and proxy servers should be configured to allow traffic on the protocols and to the servers listed below.
- Session timeouts on proxy servers and other devices should be set to values greater than the average scheduled testing time. If testing sessions are scheduled for 60 minutes, consider session timeouts of 65–70 minutes. This will help limit network interruptions during testing.
- Data cannot be cached.
- If your client network uses any device(s) that performs traffic shaping, packet prioritization, or Quality of Service, the IP addresses below should be given a high priority to guarantee the highest level of performance.

Refer to the Network Configuration section on page 9 for a list of IP addresses that should be open or whitelisted.

Common Network Performance Bottlenecks

All network communications are accomplished using the IP protocol suite. The LAN (local area network) must be able to route IP traffic to and from the Internet. The online testing system is delivered directly through the Internet. Students must access their tests using the appropriate secure browser. (See Section V for secure browser information.) For testing to take place, all workstations where tests will be administered must have reliable Internet connectivity.

In general, the performance of the online testing system will depend on a number of factors, including bandwidth, total number of students simultaneously testing, size of test content, secure browser installation, proxy server (if used) and the wireless networking solution (if used).
Bandwidth

Bandwidth is the amount of data traveling across the network at a given time. Bandwidth performance can be affected on either of the following networks: internal network (LAN) traffic and Internet traffic from the router. Regardless of hardware or network topology, the LAN should be analyzed to determine the potential for traffic bottlenecks.

- Schools need to factor the bandwidth requirements of each test along with all other non-test related Internet traffic in order to determine how many concurrent test sessions the schools’ Internet connections can support.
- Some tests include technology-enhanced item types and items with audio. These may increase the bandwidth required.
- Internal bandwidth is typically not a problem, as new switches generally operate between 100M bits per second and 1000M bits per second. However, LAN performance can be hindered in cases where hubs are used instead of switches. A hub device will allow broadcast signals from various network devices to propagate across the network, potentially saturating the network and causing traffic competition and/or collisions of data.
- For Internet networks, the most common bottleneck is the ISP’s router connection, which is typically anywhere from 1.5M bits per second to 100M bits per second. Network administrators should spend time prior to test administration determining whether their Internet infrastructure has the capacity to accommodate current and future growth.

Determining whether infrastructure is capable of current and future growth involves a number of steps, including but not limited to: (1) the analysis of the current number of users; (2) current day-to-day Internet bandwidth statistics; and (3) the desired response time for applications.

AIR provides a tool to check your school network’s current bandwidth. The instructions for accessing the network diagnostics tool is on page 9, in the Network Diagnostics Tools section.

Total number of students simultaneously testing.

As the number of students increases, competition for network bandwidth increases. Network bandwidth resembles highway traffic; as the number of cars traveling on a given road increases, the speed of traffic flow decreases.

Size of the test content.

The size of the test is determined by two factors: (1) the number of items on the test and (2) the average size of each item. The more items a test contains and the larger the average size of a test item, the higher the bandwidth requirement for a given test. For example, ELA tests typically deliver all items associated with a passage at one time, and this may slightly the bandwidth for these tests.

Secure browser installation.

The recommended installation of the secure browser(s) is local installation on each individual testing workstation. It is possible to install the secure browser on a network or shared drive and then have the testing workstations run the secure browser from that drive, but there may be some performance impacts under this configuration. There will be competition for network bandwidth, and the network or shared disk drive will also be subject to some resource competition as there will be multiple clients reading from the network drive, thus slowing the overall processing speed.
Wireless Networking

Over the past several years, there have been several revisions to wireless networking technology.

- 802.11n is the fastest and most recent IEEE wireless standard, with a throughput of up to 300M bits per second.
- 802.11g has a theoretical throughput of up to 54M bits per second.
- 802.11b has a theoretical throughput of 11M bits per second.

**Wireless Security** – Due to the sensitivity of test-related data, it is highly recommended that wireless traffic use WPA2/AES data encryption. Because encryption/decryption is part of the data exchange process, there may be a slight decrease in the overall speed of the network. A properly configured wireless network should provide adequate bandwidth for the testing applications.

Wireless access points.

AIR recommends that schools maintain a ratio of wireless systems to wireless access points (WAPs) of no more than 20 to 1. Typically, the test performance begins to deteriorate after that threshold has been reached. In some instances, older WAPs may also see performance degradation when more than 15 devices are concurrently attached.

**Recommendations on the optimal number of student workstations per wireless connection:**

The optimal number of student workstations supported by a single wireless connection will depend on the type of networking standard being used for the connection and the bandwidth demands of each test. The two most common networking standards are 802.11g (54M bits per second) and the newer and faster standard, 802.11n (300M bits per second). Both the access point, which emits the wireless signal, and the computer’s wireless card, which receives the signal, will use one of these two standards. The recommendations below are based on the standard in use:

1. Wireless connections using an 802.11g access point can reliably support a maximum of 20 PC and/or Mac workstations that use wireless cards with either the 802.11g or the 802.11n standard.

2. Wireless connections using an 802.11n access point can reliably support a greater number of workstations; however, the number of additional workstations that the 802.11n access point can support will be impacted by the actual make and model of the access point equipment itself. Thus, the manufacturer’s documentation should be consulted for verification. Typically, when all workstations are using an 802.11n wireless card, the 802.11n access point can support approximately 40 computers. In cases where the workstation wireless cards are a mix of both 802.11n and 802.11g, supported connections should not exceed 50 workstations.
Network Diagnostic Tools

A performance analysis of the LAN/Internet infrastructure is recommended in order to identify any bottlenecks that may impact test performance. Identifying the diagnostic tool most appropriate for a network depends on the testing operating system, the network administrator’s knowledge base and the desired level of network analysis. The Internet offers a number of network diagnostic tools, including, but not limited to, the following:

**AIR’s Network/Bandwidth Diagnostic Tool**

AIR provides a diagnostic tool that can be directly accessed from the Smarter Balanced portal (http://sbac.portal.airast.org).

1. From the portal home page, click either the [Training Test] or the [Pilot Test] link.
2. Click the [Diagnostic Tools] button. The Diagnostic Screen page will display.
3. In the Network Diagnostics section, select a test.
4. Select the approximate number of students who may take that test at one time.
5. Click [Run Network Diagnostics Tests] button.

The results will display your current upload and download speed as well as a general idea of whether you can reliably test the given number of students (the number entered in step 3). You may want to run this test several times throughout the day to verify that your upload and download speeds remain relatively consistent.

**Microsoft Windows specific.**

**PRTG Traffic Grapher** (www.paessler.com/prtg)

This Windows software monitors bandwidth usage and other network parameters via Simple Network Management Protocol (SNMP). It also contains a built-in packet sniffer. A freeware version is available.

**NTttcp** (www.microsoft.com/whdc/device/network/TCP_tool.mspx)

NTttcp is a multithreaded, asynchronous application that sends and receives data between two or more endpoints and reports the network performance for the duration of the transfer.

**Pathping**

Pathping is a network utility included in the Windows operating system. It combines the functionality of Ping with that of Traceroute (Windows filename: tracert) by providing details of the path between two hosts and Ping-like statistics for each node in the path based on samples taken over a time period.

**Mac OS X specific.**

**Network Utility.app**

This tool is built into Mac OS X software (10.4 or greater).
**Multi-Platform.**

**Wireshark** (www.wireshark.org)

Wireshark (formerly Ethereal) is a network protocol analyzer. It has a large feature set and runs on most computing platforms including Windows, OS X, Linux, and UNIX.

**TCPDump** (http://sourceforge.net/projects/tcpdump)

TCPdump is a common packet sniffer that runs under the command line and is compatible with most major operating systems (UNIX, Linux, Mac OS X). It allows the user to intercept and display data packets being transmitted or received over a network.

A Windows port WinDump is also available (www.winpcap.org/windump/).

**Ping, NSLookup, Netstat, Traceroute** (in Windows: tracert)

This is a set of standard UNIX network utilities. Versions of these utilities are included in all major operating systems (UNIX, Linux, Windows, and Mac OS X).

**Iperf** (http://sourceforge.net/projects/iperf/)

Iperf measures maximum TCP bandwidth, allowing the tuning of various parameters and User Datagram Protocol (UDP) characteristics. Iperf reports bandwidth, delay jitter and datagram loss.
Network Configuration

Protocols.

All communication with the Online Testing System takes place over the following Internet port/protocol combinations. Please ensure that the following ports are open for these systems.

Table 1. Ports for Online Testing System

<table>
<thead>
<tr>
<th>Port/Protocol</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>80/tcp</td>
<td>HTTP (initial connection only)</td>
</tr>
<tr>
<td>443/tcp</td>
<td>HTTPS (secure connection)</td>
</tr>
</tbody>
</table>

Domain name resolution.

The following URLs must be resolvable by all client hosts attempting to connect to the Online Testing System. This means that the client workstations should be able to convert the friendly name (URL) below to the IP address by requesting the information from the DNS server.

Table 2. Online Testing System Domain Names

<table>
<thead>
<tr>
<th>URL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sbac.portal.airast.org</td>
<td>Smarter Balanced portal/secure browser installation files</td>
</tr>

<td></td>
</tr>
</tbody>
</table>
Firewall, content filter, and proxy servers.

Content filters, firewalls, and proxy servers should be configured to allow traffic on the protocols listed above to the applications’ servers listed below. In addition, session timeouts on proxy servers and other devices should be set to values greater than the average duration it takes a student to complete a given test. For more information, contact the Smarter Balanced Help Desk.

Schools will need to make sure that information is not blocked in their web filters and that data are not cached. Please ensure that the following IP addresses are open for these systems:

Table 3. IP Addresses and URLs to Whitelist

<table>

</tbody>
</table>

Quality of Service (QoS)/Traffic shaping.

If the client network utilizes any device(s) that performs traffic shaping, packet prioritization, or Quality of Service, the above IP addresses should be given a high level of priority in order to guarantee the highest level of performance.
Certificate revocation list.

Schools should open their firewalls to allow the secure browser to check the certificate authenticity at VeriSign’s Certificate Revocation List (CRL) at http://crl.verisign.com/.

Alternatively, schools can open their network to the following IP address ranges:

Table 4. VeriSign IP Addresses

Section II. Hardware Requirements

Smarter Balanced Technology Requirements

Please ensure that your school’s computers meet the requirements indicated in the Smarter Balanced Technology Requirements (www.smarterbalanced.org/smarter-balanced-assessments/technology/).

The information in this section provides at-a-glance charts of supported operating systems and related hardware recommendations and requirements for monitors/screens, printers, keyboards, and headphones.

Table 5 organizes requirements and recommended specifications for each supported operating system for desktops and laptops. Table 6 provides information regarding supported mobile tablets.

*Due to the number of tablets available, testing all devices’ browsers for compatibility with the Online Testing System is not feasible. Please check your device’s specifications and ensure that it is running a supported operating system. Using other devices is not prohibited; however, not all functions and features may work properly.
Other Hardware Recommendations
The following information is general. Because of the myriad ways school networks and computers can be set up, we encourage you to verify diagnostics, especially with monitor resolution and headphones.

**Monitor/Screen Displays**
- Screen Dimensions: 10” class or larger, iPads with a 9.5” display are an accepted part of this class
- Resolution: 1024 x 768 or better

Depending on the screen size, some individuals may need to use vertical and/or horizontal scroll bars to view all test-related information. Students may also use the Zoom tool in the online test to enlarge the content on the screen.

*Note about brightness/contrast:*
Some test items include images that are shaded. Because monitors and screens vary widely, we cannot guarantee that the “default” settings that monitors are shipped with are optimal. Monitor settings may need to be adjusted if a student says test items with shaded images (e.g., pie charts) are very light or cannot be seen.

**Printers.**
Test Administrators can print out test session information and can approve student requests to print stimuli or test items (for students with the print-on-request accommodation). In order to preserve test security, Test Administrators must follow the test security protocols for printed test materials included in the *Test Administration Manual.*

We strongly suggest that Test Administrators be connected to a single local or network printer in the testing room. Only the Test Administrator’s computer should have access to this printer.

*Special note regarding printing support:*
At this time, Apple iOS devices are the only ones that have native printing support (AIR Print, which connects to printers on a wireless network). If users need to print, they must use a computer or mobile device that is connected to a printer.

For information about Braille devices, please see Section IV.

**Keyboards**
Smarter Balanced is making external keyboards a requirement for tablets for all students. Any form of external keyboard that disables the on-screen virtual keyboard is acceptable. This includes mechanical, manual, and Bluetooth-based keyboards.
Headphones

All ELA tests contain several items that have recorded audio. Students with the text-to-speech accommodation can listen to stimuli or test items being read aloud. Students with a Braille accommodation can use JAWS to listen to math assessments.

Students taking the ELA or who have a TTS or Braille accommodation must be provided with headphones so that they can listen to the audio in these tests. We encourage you to work with your School Coordinator to determine how many students will need headphones to ensure that you have an adequate supply on hand.

USB headphones are recommended, as they are typically plug-and-play devices.

Text-to-speech is supported only on desktops and laptops. Students who require the text-to-speech accommodation should not use tablets.

Refer to Section VII, Text-to-Speech for specific information on verifying that the headphones are recognized by the computer.
Section III. Software Requirements

Please ensure that your school’s computer software meet the requirements indicated in the Smarter Balanced Technology Requirements (www.smarterbalanced.org/smarter-balanced-assessments/technology/).

About Mozilla Firefox

Mozilla releases updated versions of Firefox regularly, approximately every six weeks, and each new version must be tested with each system to ensure compatibility. While newer versions of Firefox can be used with the Training Tests and the Test Administrator sites, they may not work optimally right away.

Disabling Pop-Up Blockers

Your web browser’s pop-up blocker must be disabled when accessing any of AIR’s online testing systems. Your school administrator or IT staff designee may be able to disable pop-up blockers ahead of time. Navigate to the appropriate menu option to disable pop-up blockers.

To disable pop-up blockers:

- Firefox: Tools > Options > Content > uncheck “Block pop-up windows”
- Internet Explorer: Tools > Pop-up Blocker > Turn Off Pop-up Blocker
- Safari: Application Menu (Safari) > Block Pop-Up Windows (make sure this is unchecked)

Installing the Verdana Font on Linux Machines

Some test items use the Verdana font. Please ensure that you have Verdana appropriately installed on all Linux machines that will be used for testing.

Microsoft TrueType fonts like Verdana are freely available for download and installation on computers running Linux. However, the End User License Agreement for these fonts restricts their direct inclusion in Linux distributions. Therefore, these fonts must be installed as an add-on. Please refer to the Linux secure browser installation document for additional information.

- **Fedora Core 6 users**
  Follow the steps in the “How to Install” section of this website: http://corefonts.sourceforge.net/.
  You will need to build an rpm package of the fonts prior to installing them.

- **Ubuntu 9–12 users**
  In a terminal window, enter the following command to install the msttcorefonts package:
  ```
  sudo apt-get install msttcorefonts
  ```
Special Note for Windows Users: Fast User Switching

Microsoft Windows (XP with Service Pack 3, Vista, 7, and 8) allows computers to be configured so that multiple users can log into a computer without requiring one user to log out before another logs in. This feature is called “fast user switching.”

If a student can access multiple user accounts from a single computer, we strongly encourage you to disable the Fast User Switching function. Instructions for doing so follow.

Disabling Fast User Switching in Windows XP (with Service Pack 3)

1. Click [Start], click [Control Panel], then click [User Accounts].
2. Click [Change the Way Users Log On or Off].
   a. Ensure the Use the Welcome Screen option is checked.
   b. Ensure the Use Fast User Switching option is not checked.
3. Click [Apply Options].

*Please note that Fast User Switching is not an option if joined to a domain.
Disabling Fast User Switching in Windows Vista or 7

Method A: Access the Group Policy Editor
1. Click [Start], type gedit.msc in the Start Search dialog box, and press [Enter].
2. Navigate to the following location:
   Local Computer Policy > Computer Configuration > Administrative Templates > System > Logon
3. Set Hide entry points for Fast User Switching to Enabled.
5. Close the Group Policy window.

Note: Because the Group Policy Editor does not exist in certain editions of Windows Vista, you may need to configure these settings via the registry if this method is unavailable. See Method B for registry instructions.

Method B: Access the Registry
1. Click [Start], type regedit.exe in the Start Search dialog box, and press [Enter].
2. Navigate to the following location:
   HKEY_LOCAL_MACHINE > SOFTWARE > Microsoft > Windows > CurrentVersion > Policies > System
3. Right-click the System folder in the left pane.
4. Click New, DWORD (32-bit) value.
5. Type in HideFastUserSwitching and press [Enter].
6. Click the HideFastUserSwitching value.
7. Type 1 into the Value data box and click [OK].
8. Close the Registry Editor window.
**Disabling Fast User Switching in Windows 8**

1. Navigate to the Search option (from the home screen, mouse to the lower right corner and then click the Search icon.

2. In the search box, type `gpedit.msc`. Double-click the `gpedit` icon in the Apps pane. The Local Group Policy Editor window will open.

3. Navigate to the following location: 
   
   `Computer Configuration > Administrative Templates > System > Logon`

4. In the Setting pane, double-click “Hide entry points for Fast User Switching.”

5. Select “Enabled” and then click `[OK]`.

6. Navigate to the Search option (from the home screen, mouse to the lower right corner and then click the Search icon.

7. In the search box, type `run`. The Run dialogue box will open.

8. Enter the command `gpupdate /force` into the text box and then click `[OK].`

   *(Note the space before the backslash).*
9. The Windows system command box will open. When you see the message “Computer Policy update has completed successfully,” then Fast User Switching has been successfully disabled.
Section IV. Text-to-Braille Hardware and Software

Braille Hardware

The following devices are to be used for students accessing tests with a Braille accommodation.

- **For students:** A refreshable Braille display. We recommend that the display have a minimum of 40 cells.
- **For Test Administrators:** View Plus Tiger Max Embosser

**Reminder:** All printed test materials must be shredded immediately after a test session ends.

Braille Software

*Requirements for Student Computers*

- The Student Testing Site currently supports the Braille interface on Windows 7 machines only.
- Windows Secure Browser 6.0 must be installed on all machines used for student testing, including tests administered using the Braille interface.
- JAWS Screen Reader (version 12 or 13).
- Refreshable Braille display that is compatible with Windows 7 and the version of JAWS that is on the computer (12 or 13). We recommend that the Braille display have a minimum of 40 cells.

For more information about JAWS, including product download and purchase, go to http://www.freedomscientific.com/products/fs/jaws-product-page.asp.

The following JAWS configuration must be applied to each student computer prior to administering tests using the Braille interface:

1. Configure JAWS to recognize the Secure Browser.
2. Apply settings for Contracted/Uncontracted Braille through JAWS.

**Instructions for each requirement follows.**

**Configure JAWS to Recognize the Secure Browser**

1. Open the JAWS ConfigNames.ini file.
   This file is accessible via the start menu (/All Programs/JAWS 12.0/Explore JAWS/Explore Shared Settings/).
2. Locate the line of text that contains “Chrome=Firefox.” Create a line immediately following this text, and add the following string:
   
   SBACSecureBrowser6.0=Firefox

3. Save the file upon completion.

If you receive an error that you do not have permission to save the .ini file to this location, you will first need to save the file to your desktop as ConfigNames.ini. After saving the updated .ini file, copy it to the folder containing the original .ini file (referenced in Step 1). You will need to confirm that you want to replace the original file with the file you created.
Applying Settings for Contracted/Uncontracted Braille

In order for students to use Contracted or Uncontracted Literary Braille, the correct JAWS setting must be applied prior to launching the secure browser.

1. Open the JAWS Settings Center. The Settings Center is accessible via the JAWS Menu > Utilities.
2. Select Firefox from the “Application” drop-down menu.
3. From the panel on the left side of the window, go to the following option (as pictured):

   Braille > General > Translation > Contracted Braille Translation

4. For **Uncontracted Braille**, set the value to “Off.”
   For **Contracted Braille**, set the value to “Input and Output.”

5. Click [Apply] and then click [OK].

   ![](image1.png)

   In addition, the following optional JAWS settings may be adjusted for individual students based on student needs prior to administering their assessments.

   - Adjust JAWS voice profile (Optional)
   - Adjust JAWS speaking speed (Optional)
   - Adjust JAWS punctuation (Optional)

   **Instructions for each option follows.**

   If adjusting these optional settings for a student, the steps described for each option must be taken prior to launching the secure browser.
**Adjusting JAWS Voice Profile**

The JAWS voice profile refers to the voice used by JAWS. Users can adjust the JAWS voice profile by following the instructions below.

1. Go to JAWS Menu > Options.
2. Select Voices > Adjustment.
3. In the Profile section, select a Voice Profile from the Name drop-down menu.
4. Click [OK].

---

**Adjusting JAWS Speaking Rate**

Users can adjust the rate of speed that JAWS speaks by following the instructions below.

1. Go to JAWS Menu > Options.
2. Select Voices > Adjustment.
3. In the Voice section, adjust the “Rate” using the slide-bar.
4. Click [OK].

---

**Adjusting JAWS Punctuation**

The default JAWS punctuation setting for which the Braille Interface has been optimized is “Most.” This means that JAWS will read most punctuation that appears on the screen. However, users may adjust the JAWS punctuation based on an individual student’s needs and preferences by following the instructions below.

1. Go to JAWS Menu > Options.
2. Select Voices > Adjustment.
3. In the Voice section, select a punctuation setting from the Punctuation drop-down menu. The options include “None,” “Some,” “Most,” and “All.”
4. Click [OK].

---

**Warning regarding ELA assessments and text-to-speech and JAWS**

Because the text-to-speech accommodation is not fully approved for use with the ELA assessments (items only), the sound on the student’s computer will be automatically muted when the student begins the first question on the Braille form of the ELA assessment. The sound will automatically turn on again when the student submits the ELA assessment or pauses the test and returns to the login screen.

Some students may require assistance with JAWS navigation during the reading test because they will not be able to hear the JAWS commands when the sound is muted. JAWS will still output all commands and text to the refreshable Braille display, even with the sound on the computer muted.
Requirements for Test Administrator Computers

TAs administering tests to students who require Braille must have the following software installed on their machine prior to testing. The software is necessary to process these students’ print requests.

- **Duxbury Braille Translator 11.1**  
  This software allows printing of items and reading passages (without images) and can be downloaded from [http://www.duxburysystems.com/dbt.asp?product=DBT%20Win](http://www.duxburysystems.com/dbt.asp?product=DBT%20Win).

  *For Oregon users*: To download the Duxbury Braille Translator software and acquire a license, contact the BVIS fund administrator for the seat license code.

- **ViewPlus Tiger Max Embosser** and the supporting **ViewPlus Desktop Embosser driver**  
  The Desktop Embosser Driver can be downloaded from [http://downloads.viewplus.com/drivers/desktop-braille-embosser/](http://downloads.viewplus.com/drivers/desktop-braille-embosser/). The download includes the Tiger Viewer software, which is needed to handle print requests for items and passages that contain tactile or spatial components.
Section V. Secure Browser Installation

All students must use a secure browser to access the Pilot Test. These secure browsers prevent students from accessing other computer or Internet applications or copying test information. All computers that will be used for testing must have the correct secure browser installed.

The appropriate secure browser must be installed on each computer that will be used for online testing. All secure browsers can be accessed from the Smarter Balanced portal (sbac.portal.airast.org).

Figure 1. Smarter Balanced Portal Secure Browser Page

Secure browsers are available for the following operating systems:

- Windows XP (Service Pack 3), Vista, 7, and 8
- Mac 10.4 (PowerPC or Intel processors) and 10.5 with PowerPC processors
- Mac 10.5, 10.6, 10.7, and 10.8 with Intel processors
- Linux Fedora Core 6 and Ubuntu 9–12
- Apple iOS 6.0 and above (for iPads 2 and above)
- Android 4.0 and above (for Google Nexus 10, Motorola Xoom, Motorola Xyborg, Samsung Galaxy Note 2 (10.1), and Samsung Galaxy Tab 2 (10.1))

Secure testing will also be available for Google Chromebooks.

For Consortium states that already have AIR secure browsers for statewide testing this year, the secure browsers for the Smarter Balanced Pilot Test will NOT require you to uninstall your secure browser. However, this secure browser will not allow students to access your statewide assessments. Students MUST use the appropriate secure browser to access those sites.
The secure browser should be installed on each individual computer that will be used for student testing. You can install the secure browser on each individual computer, either one-by-one or through a network.

**One-by-One (Manual) Installation for Desktops and Laptops**

- From each computer to be used for testing, access the Internet and download and install the browser OR
- Download and save the browser onto a media device (such as a flash drive) and then copy and install the files onto each computer OR
- Download and save the browser to a network folder and then copy it onto each computer.

For any of these options, go to the secure browsers page and download and install the browser to your desired location (an individual computer, a media device, or a network folder).

**Network Installation (Network Administrators)**

You can push the browser out to all computers through a network by copying browser files from the network to individual computers or through third-party programs to run the installers, such as Apple Remote Desktop.

For additional information, read the *Network Installation for Windows (Network Administrators)* and *Network Installation Information for Mac OS X* sections in this document.

**Installation without Administrator Rights**

If you must install the secure browser on computers to which you do not have administrator or installation rights, read the *Installing the Secure Browser on Computers without Administrator Rights (Windows)* section in this document.
Windows Secure Browser (Version 6.0)

This section provides instructions for installing the Windows secure browser on computers with Windows XP (Service Pack 3), Vista, 7, or 8. Other Windows operating systems are not supported.

You must install version 6.0 of the secure browser on each computer that will be used for online testing.

*Note: The installation file for Windows computers is an .msi file, which requires administration rights. The steps below assume an administrator is installing the secure browser.*

**Installing Windows Secure Browser 6.0.**

**Manually Installing the .msi Package via the User Interface:**

1. From the Windows section on the Download Secure Browser page on the Smarter Balanced portal, click the [Download Browser] link. A dialog box will pop up.
   
   *Note: This step may vary slightly depending on the browser you are currently using.*

   • If presented with a choice to either “Run” or “Save” the file, select “Run.” This will install the secure browser directly without the need to save the installation package to your computer.
     
     – If you receive a Security Warning at this point, select “Run” from the preceding dialog box.

   • If presented only with the option to [Save], save the file to a convenient location, such as the desktop.
     
     o Double-click the installation file (SBACSecureBrowser6.0-Win.msi) to open the Secure Browser Setup Wizard. *(Note: This step applies only to users who saved the file to their computer. Users who selected “Run” in Step 1 can go directly to Step 2.)*

2. From the Secure Browser Setup Wizard, follow the instructions on the screen to finish installation. Select the Standard installation option to install the browser in its default location: C:\Program Files\SBACSecureBrowser6.0.

3. Click [Finish] to launch SBAC Secure Browser 6.0 directly from the Setup Wizard OR double-click the SBAC Secure Browser 6.0 icon that is on the desktop.

4. Upon launching the secure browser, you will see the student login screen.

   *Note: The browser will fill the entire screen.*

5. Click [Close] in the upper right corner to exit the browser.

   *Note: You can also use the following keyboard command to close the Windows secure browser: [Ctrl] + [ALT] + [SHIFT] + [F10]. (If you are using a laptop, you may also need to press the [FN] key before you press F10.)*
Installing the .msi Package via a Script.

Network administrators can install the Windows secure browser via an installation script to be executed by an Admin account in the machine. The script can be written to run without any human interaction (quiet switch) and to install in the default directory (C:\ProgramFiles) or any target directory of choice. Un-installation can also be scripted.

Below are two generic scripts: one for installation and one for uninstallation. Both require the script to have visibility to the .msi installation file and can only be executed by an admin account on the machine. (This is a Windows-based restriction, not a secure browser restriction, as the msiexec service that installs .msi files is meant to be used by administrators only.)

Script Conventions:

<Source> = Complete path to the Secure Browser 6.0 msi installation file including .msi installation file name
Example: C:\MSI\SBACSecureBrowser6.0-win.msi

<Target> = Complete path to the location where the Secure Browser should be installed if the default location (C:\ProgramFiles) is not preferred
Example: C:\MSI\Installation_Dir

Note: the target install directory does not have to be created in advance.

1. Installation script: msiexec /I <Source>/quiet INSTALLDIR=<Target>
   Example: msiexec /I C:\MSI\SBACSecureBrowser6.0-win.msi /quiet INSTALLDIR=C:\MSI\Browser_Install

2. Uninstallation script: msiexec /X <Source>/quiet
   Example: msiexec /X C:\MSI\SBACSecureBrowser6.0-win.msi /quiet

Manually uninstalling the Windows secure browser.

If you need to uninstall the secure browser for any reason, follow the steps below.

1. Open the Control Panel (from your taskbar, select Start > Settings > Control Panel).
2. Select Add or Remove Programs.
3. Select SBACSecureBrowser6.0 and click [Remove] to open the Uninstall Wizard.
4. Click [Next].
5. Click [Uninstall] to remove the secure browser.
6. Click [Finish] to complete the uninstall process.
Mac OS X Secure Browser for 10.4 and 10.5 (Version 5.5)

This section provides instructions for installing secure browser 5.5 on the following computers:

- Mac 10.4 computers with either PowerPC or Intel-based processors
- Mac 10.5 computers with PowerPC processors

**How do I know if my Mac 10.5 computer is using a PowerPC or Intel-based processor?**

From the Apple drop-down menu, click “About This Mac.” The screen will indicate the operating system version and processor your computer is using.

- If you are using 10.4, download and install secure browser 5.5 using the instructions in this document. (The processor type does not matter.)
- If you are using 10.5 and you see PowerPC, download and install secure browser 5.5 using the instructions in this document.
- If you are using 10.5 and you see Intel, refer to the Installing Secure Browser 6.1 for Mac OS X document for instructions.

**Use Secure Browser 5.5**

You must install version 5.5 of the secure browser on all Mac 10.4 and 10.5 computers with PowerPC processors that will be used for online testing. We strongly recommend that you install the secure browser on each individual computer. **Please note: Students must have the correct secure browser in order to access the online assessments.**
Installing Secure Browser 5.5 for Mac OS X 10.4 and 10.5 (with PowerPC).

1. From the Mac OS X 10.4 and 10.5 with PowerPC section on the Download Secure Browser page on the Smarter Balanced portal, click the [Download Browser] link. (If prompted for a download location, select the desktop.) Note: This step may vary slightly depending on the browser version you are using.
   - If your browser automatically expands the Zip file, you can proceed to Step 3.
   - If your computer opens the Software License Agreement page, proceed to Step 4.
   - If you receive a warning message that the file contains an application, click [Continue] and proceed to Step 4.

2. Open the file (SBACSecureBrowser5.5-OSX.dmg) to expand its contents. Double-click the file (SBACSecureBrowser5.5-OSX.dmg) to mount the SBACSecureBrowser5.5 folder on the desktop. 
   Note: Your computer may automatically expand the file upon download.

3. Double-click the mounted folder (SBACSecureBrowser5.5).

5. Drag the SBACSecureBrowser5.5 icon to your Applications folder.
   Important: The secure browser must be launched at this point to successfully complete the installation. The browser will disable Exposé (hot corner) settings if they are set and they will remain disabled after the browser is closed. The dock will appear the first time the Exposé settings are being disabled on browser launch. System security will not be affected as applications opened from the dock open in the background and cannot be accessed.

6. Double-click the SBACSecureBrowser5.5 icon in the Applications folder to launch the secure browser. Upon launching the secure browser, you will see the student login screen. Note: The browser will fill the entire screen.

7. Click [Close] in the upper right corner to exit the browser.
   Note: You can also use the following keyboard command to close the Mac OS X secure browser: [Ctrl] + [ALT] + [SHIFT] + [F10]. (If you are using a laptop, you may also need to press the FN key before you press F10.)

Uninstalling the Mac OS X secure browser.

If you need to uninstall the secure browser for any reason, follow these instructions.

There may be a folder on the desktop named SBACSecureBrowser5.5. Simply drag the folder and related files to the Trash. If the browser was installed to a different location, please be sure to remove it accordingly.
Mac OS X Secure Browser for 10.5–10.8 (Version 6.1)

This section provides instructions for installing secure browser 6.0 on computers with OS 10.5–10.8 and that have Intel-based processors. (Some Mac 10.5 computers have PowerPC processors and others have Intel-based processors. All Mac computers with OS 10.6, 10.7 or 10.8 have Intel-based processors.)

Information about disabling Spaces and enabling Java on Mac 10.7 and 10.8 computers is also included in this section.

**How do I know if my Mac 10.5 computer is using a PowerPC or Intel-based processor?**

From the Apple drop-down menu, click “About This Mac.” The screen will indicate the operating system version and processor your computer is using.

- If you see PowerPC, refer to the *Installing Secure Browser 5.5 for Mac OS X* document for instructions.
- If you see Intel, download and install secure browser 6.1 using the instructions in this document.

---

**Use Secure Browser 5.5**

**Use Secure Browser 6.1**

You must install version 6.1 of the secure browser on all Mac 10.5, 10.6, 10.7, and 10.8 computers with Intel processors that will be used for online testing. We strongly recommend that you install the secure browser on each individual computer. **Please note: Students must have the correct secure browser in order to access the online assessments.**
Installing Secure Browser 6.1 for Mac OS X 10.5–10.8 (with Intel).

1. From the Mac OS X 10.5–10.8 section of the Secure Browser page on the Smarter Balanced portal, click the [Download Browser] link. (If prompted for a download location, select your desktop.) *Note: This step may slightly vary depending on the browser you are currently using.*
   - If your browser automatically expands the Zip file, you can proceed to Step 3.
   - If your computer opens the Software License Agreement page, proceed to Step 4.
   - If you receive a warning message that the file contains an application, click [Continue] and proceed to Step 4.

2. Open the file (SBACSecureBrowser6.1-OSX.dmg) to expand its contents. Double-click the file (SBACSecureBrowser6.1-OSX.dmg) to mount the SBACSecureBrowser6.1 folder on the desktop. *Note: Your computer may automatically expand the file upon download.*

3. Double-click the mounted folder (SBACSecureBrowser6.1).

5. Drag the SBAC Secure Browser 6.1 icon to your Applications folder. **Important:** The secure browser must be launched to successfully complete the installation.
   - For Mac 10.5, the secure browser will disable Exposé (hot corner) settings if they are set and they will remain disabled after the browser is closed.
   - For Mac 10.6, Exposé settings will be disabled only when the secure browser is launched. The dock will appear the first time the Exposé settings are being disabled on browser launch. System security is not affected as applications opened from the dock open in the background and cannot be accessed.
   - For Mac 10.7 and 10.8, Spaces must be manually disabled before student can use the secure browser. Instructions for disabling the Spaces feature are on the next page.

6. Double-click the SBACSecureBrowser6.1 icon in the Applications folder to launch the secure browser. Upon launching the secure browser, you will see the student login screen. *Note: The browser will fill the entire screen.*

7. Click [Close] in the upper-right corner to exit the browser.  
   *Note: You can also use the following keyboard command to close the secure browser: [Ctrl] + [ALT] + [SHIFT] + [F10]. (If you are using a laptop, you may also need to press the [FN] key before you press [F10].)*

Uninstalling the Mac OS X secure browser.

If you need to uninstall the secure browser for any reason, follow these instructions.

There may be a folder on the desktop named SBACSecureBrowser6.1. Simply drag the folder and related files to the Trash. If the browser was installed to a different location, please be sure to remove it accordingly.
Disabling Spaces in Mission Control on Mac 10.7 and 10.8 computers.

Follow the instructions below to disable Spaces. Spaces should be disabled on computers that students will be using.

1. Navigate to Apple → System Preferences

2. In System Preferences, click the [Keyboard] icon. The Keyboard window will be displayed.

3. Click the [Keyboard Shortcuts] tab. The Keyboard Shortcuts options will be displayed.

4. In the left panel, click “Mission Control.” The right panel will show all Mission Control options.

5. In the right panel, make sure the boxes for the following are NOT checked:
   - Move left a space
   - Move right a space
   - Switch to Desktop 1 (this may already be unchecked.)

6. To re-enable Spaces, follow steps 1–4 again, and check the boxes for spaces.
Enabling Java on Mac OS 10.7 and 10.8 computers.

Apple has begun disabling Java by default on machines running OS 10.7 and above. As Java is not packaged with the Mac secure browsers, you need to ensure that Java is enabled on all 10.7 and 10.8 machines that students will use. Before following the steps below, ensure that any browsers, including the secure browser, are closed.

Note: Java is required to run the network diagnostics only; not to run the secure browser and access an online assessment.

1. Navigate to Finder ➔ Go ➔ Applications

2. On the Applications screen, click Java Preferences.app. The Java Preferences screen will open.

3. On the [General] tab, ensure that the Java application has a check mark. (You may have multiple versions of Java.)

Make sure that “Enable applet plug-in and Web Start applications” is also checked.

The next time you open a web browser, including the secure browser, Java should run.
Linux Secure Browser (Version 6.0)

This section provides instructions for installing the Linux secure browser on computers with Linux Fedora Core 6 (K12LTSP 4.2 and above) or Ubuntu 9–12.

You must install version 6.0 of the secure browser on each computer that will be used for online testing. We strongly recommend that you install the secure browser on each individual computer. *Please note: Students must have the correct secure browser in order to access the online assessments.*

**Installing Linux Secure Browser 6.0.**

1. From the Linux tab on the Download Secure Browser page on the Smarter Balanced portal, click the [Download Browser] link and save the file to your desktop.

2. Right-click the downloaded file (SBACSecureBrowser6.0-Linux.tar.bz2), and select “Extract Here” to expand the file. This creates the SBACSecureBrowser6.0 folder on the desktop.

   *Note: To expand the compressed image using command line, use the following command:*

   ```
   tar jxvf SBACSecureBrowser6.0-Linux.tar.bz2
   ```

3. Open the SBACSecureBrowser6.0 folder.
   
   - Double-click the file “install-icon.sh” and select “Run” from the prompt. *(Note: This will create the “SBACSecureBrowser6.0” icon on the desktop.)*

4. From the desktop, double-click the SBACSecureBrowser6.0 icon to launch the browser.

5. Upon launching the secure browser, you will see the student login screen.

   *Note: The browser will fill the entire screen.*

6. Click [Close] in the upper right corner to exit the browser.

   *Note: You can also use the following keyboard command to close the Linux Secure Browser: [CTRL] + [ALT] + [SHIFT] + [ESC]. (If you are using a laptop, you may also need to press the [FN] key before you press F10.)*

   *If you do not want to run the installer, you can extract the files by opening the SBACSecureBrowser6.0 file and selecting “Run” from the options in the message dialog box.*

**Uninstalling the Linux secure browser.**

If you need to uninstall the secure browser for any reason, follow these instructions.

There should be a folder on the desktop named SBACSecureBrowser6.0. Simply drag the folder and the secure browser icon from the Desktop to the Trash. If the browser was installed to a different location, please be sure to remove it accordingly.
Linux 64-bit Machines and the secure browser.

The secure browser is a 32-bit browser. If you have Linux machines that are 64-bit, the secure browser will not launch properly. This is because 64-bit versions of Linux typically do not have 32-bit compatibility libraries installed.

In order for the secure browser to run, the 32-bit compatibility library for your Linux version must be installed. As the commands for doing so vary between Linux distributions, we encourage you to check the documentation for your specific Linux version or setup.

The following command prompts should work for supported versions of Fedora Core 6 K12LTSP and Ubuntu:

**Fedora Core 6 K12LTSP 4.2+:** `yum install glibc.i686`
*Note: You must run this command as the root user.*

**Ubuntu:** `sudo apt-get install ia32-lib`
Network Installation for Windows (Network Administrators)

You can install the secure browser to all computers on a network by copying browser files from the network to individual computers or through third-party programs to run the installers, such as Apple Remote Desktop.

This section contains information for installing the secure browser via a network. Please follow the appropriate instructions for your network setup.

**Installing the secure browser to a shared drive.**

1. Install the browser onto your server, following the standard directions available in this document.

2. **Map the network directory** to where you installed the secure browser (in Step 1) on each client machine.
   a. In the network location where you installed the secure browser, create a shortcut by right-clicking the SBACSecureBrowser6.0.exe icon and selecting “Create Shortcut.”
      
      • Optional: You may want to rename the new shortcut; e.g., SBACSecureBrowser6.0. (This becomes your shortcut link name that you will use in Step 3.)

   b. In the properties of the shortcut, change the path to SBACSecureBrowser6.0.exe to use the mapped path as if on the client machine.

3. To each user (computer) profile, add the following command, which will execute upon login through the user group login script:

   COPY "<X> \SBACSecureBrowser6.0.1nk" "%USERPROFILE%\Desktop"

   *Note: <X> refers to the shared directory from which the browser will be run. The script will need to reference the correct directory.*
Pushing the secure browser installation directory from the network to client computers.

1. Install the browser onto your server, following the standard directions available in this document.

2. Identify the network directory to which you saved the browser file. These instructions will refer to that network directory as <X>.

3. Identify the target directory on the local user computers that you will copy the browser file to. These instructions will refer to that directory as <Y>. Make sure that you have write access to <Y> on the local computers.

   *Note: Restricted users will have access only to certain folders on the local computers.*

4. Create a shortcut in the network directory by right-clicking the SBACSecureBrowser6.0.exe icon and selecting “Create Shortcut.” Rename the new shortcut, e.g., “SBACSecureBrowser6.0.”

   *Note: In the shortcut Properties, the “Target” and “Start In” attributes will show the <X> network installation directory.*

5. Change the shortcut properties ("Target" and “Start In” attributes) to the local computers’ <Y> directory instead of the default <X> network directory. That way the secure browser shortcut will now point to the designated installation directory.

6. Add the following lines to the login script for each user, replacing your actual local and source network directories for <Y> and <X>.

   ```
   IF EXIST <Y> GOTO DONE
   XCOPY "<X>" "<Y>" /E /I
   COPY "<Y>\SBACSecureBrowser6.0.1nk"
   "%USERPROFILE%\Desktop"
   :DONE
   EXIT
   ```
Installing the Secure Browser on Computers without Administrator Rights (Windows)

We strongly recommend that you install the secure browser on each individual computer. However, if you must use a shared network setup without administrator rights, follow the instructions below.

Once you have installed the browser on one machine, you can simply copy it to restricted accounts on other machines.

1. On a computer on which you have installation rights, download and install the browser, following the standard directions available in this document.

2. Copy the entire folder where the browser was installed (usually, “C:\Program Files\SBACSecureBrowser6.0”) to a removable drive or shared network location.

3. Copy the entire directory from the shared location or removable drive to any directory on the target computer.

4. Drag the `SBACSecureBrowser6.0.exe` icon to the desktop to create a convenient shortcut.
Terminal Server/Thin Client Installation (Windows)

The following steps should be taken when computers on a Terminal Services network setup have a shared or generic login account and multiple users need to use that same account when logging into Terminal Services.

1. **Create a batch file that runs the logon script for the secure browser.**
   This creates a unique profile folder in “Application Data” with a unique session name. This can be placed in the “Startup” folder on the “Start” menu (Start → Programs → Startup).
   a) As the Administrator, open Notepad.
   b) Copy and paste the below line into the Notepad file:
      
      \[ C:\Program Files\SBACSecureBrowser6.0\SBACSecureBrowser6.0.exe ” -CreateProfile %SESSIONNAME% \]
   c) Save the file as a batch file to the desktop (you may call it anything; e.g., logon.bat).
   d) Go to “User Configuration,” which is in the Group Policy.
   e) Navigate to ‘User Configuration’ and expand the ‘Windows Settings’ folder.
   f) Click “Scripts (Logon/Logoff).”
   g) Select “Logon” and go to “Properties” (either by clicking the Properties link on the left or right-clicking “Logon” and selecting “Properties”).
   h) In the “Logon Properties” window, click the [Add] button.
   i) Browse for the “Logon” batch file that you created in Step B.
   j) Click the [OK] button to add the file.
   k) Click the [APPLY] button and close the “Logon Properties” window.
   l) Close the “Group Policy” window.

2. **Create a shortcut on the desktop of each client machine.**
   This will create shortcuts for the secure browser on the client machines.
   a) On the Terminal Server machine, locate the Secure Browser folder.
      C:\Program Files\<SecureBrowserName> folder\
   b) Right-click the **SBACSecureBrowser6.0.exe** file and select “Send To → Desktop (Create Shortcut).”
   c) Right-click the shortcut icon on the desktop and select “Properties.”
   d) In the ‘Target’ text box, type in the below line as shown:
      \[ “C:\Program Files\SBACSecureBrowser6.0\SBACSecureBrowser6.0.exe” –P %SESSIONNAME% \]
   e) Click [OK] to close the Properties window.
      *(Optional: If you would like to rename the shortcut on the desktop, select the shortcut, press F2, and rename it from “kiosk.exe” to “SBACSecureBrowser6.0.”)*
NComputing Virtual Desktop Installation (Windows)

The following steps should be taken to install the secure browser on a network that uses NComputing virtual desktops.

1. **Create a batch file that runs the logon script for the secure browser.**
   This creates a unique profile folder in “Application Data” with a unique session name. This can be placed in the “Startup” folder on the “Start” menu (Start → Programs → Startup).
   a) As the Administrator, open Notepad.
   b) Copy and paste the below line into the Notepad file:
      
   ```
   “C:\Program Files\SBACSecureBrowser6.0\SBACSecureBrowser6.0.exe” -CreateProfile %SESSIONNAME%
   ```
   c) Save the file as a batch file to the desktop (you may call it anything; e.g., logon.bat).
   d) Go to “User Configuration,” which is in the “Remote Administration Console” window.
      - Start Menu → All Programs → NComputing vSpace → vSpace Console → Expand “Local Computer Policy”
   e) Expand “User Configuration” and expand the “Windows Settings” folder.
   f) Click “Scripts (Logon/Logoff)”
   g) Select “Logon” and go to “Properties” (either by clicking the Properties link on the left or right-clicking “Logon” and selecting “Properties”).
   h) In the “Logon Properties” window, click the [Add] button.
   i) Browse for the “Logon” batch file that you created in Step B.
   j) Click the [OK] button to add the file.
   k) Click the [APPLY] button and the close the “Logon Properties” window.
   l) Close the “Remote Administration Console” window.

2. **Create a shortcut on the desktop of each client machine.**
   **Note:** This will create shortcuts for the secure browser on the client machines.
   a) On the Terminal Server machine, locate the Secure Browser folder.
      C:\Program Files\<SecureBrowserName> folder\
   b) Right-click the SBACSecureBrowser6.0.exe file and select “Send To → Desktop (Create Shortcut)”
   c) Right-click the shortcut icon on the desktop and select “Properties”
   d) In the “Target” text box, type or copy/paste the below line as shown:
      ```
      “C:\Program Files\SBACSecureBrowser6.0\SBACSecureBrowser6.0.exe” -P %SESSIONNAME%
      ```
   e) Click [OK] to close the Properties window.
      *(Optional: If you would like to rename the shortcut on the desktop, select the shortcut, press F2, and rename it from “SBACSecureBrowser6.0.exe” to “SBACSecureBrowser6.0.exe”)*

3. **Login as an admin and run the application once.**
   Simply launching the secure browser and going to the diagnostics page is sufficient (you do not need to start a test). **Note:** In order to launch the Secure Browser on the client machines, users will need to double-click the shortcut created on the desktop.
Network Installation Information for Mac OS X (Network Administrators)

The appropriate secure browser must be installed on each computer that will be used for online testing. While we strongly recommend that you install the secure browser on each individual computer that will be used, you can also push the browser out to all computers through a network by copying browser files from the network to individual computers or through third-party installation programs.

This document provides network installation instructions for computers using the following supported Mac OS X operating systems: 10.4, 10.5, 10.6, 10.7, 10.8, and the Apple Remote Desktop application.

INSTALLING THE MAC OS X SECURE BROWSER USING APPLE REMOTE DESKTOP

1. Log into an administrator computer on your network. This computer should have Apple Remote Desktop installed and running.

2. Download the correct Mac OS X browser from the portal.

3. Click the downloaded icon to unzip and save the .dmg file onto your administrator computer.

4. Open the .dmg file and select the .app file.

5. Open Apple Remote Desktop.

7. Select one or more computers from the Computer List onto which you would like to install the secure browser.

8. Select Manage > Copy Items.

9. Select the browser .app file (from Step 4).

10. Select copy options, including your preferred destination on the target machine.

11. Click [Copy].
Secure Browsers and Proxy Settings (Updated)

By default, the secure browsers for Windows, Mac, and Linux are packaged with the proxy setting set to “auto-detect.” This setting can be overridden using the command line or by creating a shortcut.

**Specifying a proxy server to use with the secure browser.**

These secure browsers attempt to auto-detect the settings for your network’s web proxy server. You have the option to change the settings to use by passing parameters to the proxy executable.

The following proxy values are supported:

- 0 – Direct connection, no proxy
- 1 – Manual proxy configuration
- 2 – Proxy auto-configuration (PAC)
- 4 – Auto-detect proxy settings (*this is the default*)
- 5 – System proxy settings

Table 7. Proxy Server Commands

<table>
<thead>
<tr>
<th>Description</th>
<th>Command</th>
<th>Operating System</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run the browser without any proxy</td>
<td>./SBACSecureBrowser6.0 -proxy 0</td>

</tbody>
</table>

Creating a corresponding desktop shortcut to run the browser using additional parameters.

**Microsoft Windows.**

1. Navigate to the location of the Secure Browser program folder.
2. Create a shortcut by right-clicking the “SBACSecureBrowser6.0.exe” executable file.
3. Move the shortcut to the desired location, such as the desktop.
4. Right-click the shortcut icon to edit its properties.
5. In the “Target:” input field, append the additional options after the command, e.g.:
   “C:\Program Files\SBACSecureBrowser6.0\SBACSecureBrowser6.0.exe” -proxy 1:http://foo.com:80 (32-bit version)
   OR
   “C:\Program Files (x86)\SBACSecureBrowser6.0\SBACSecureBrowser6.0.exe” -proxy 1:http://foo.com:80 (64-bit version)
6. Click [OK].
Mac 10.4–10.8.

1. From the Terminal application, change to the desktop directory. (Go to Applications > Utilities > Terminal. In Terminal, type the below command and then press [Enter].)
   ```bash
cd Desktop
   ```

2. Create a `.command` file, using an editor such as pico. To do so, type the command below and then press [Enter]. This creates the securebrowser.command file on the desktop.
   ```bash
   pico securebrowser.command
   ```

   **Note:** After you type in the command in step 2 and press [Enter], Terminal should look like this:

3. Edit the file to be similar to the following, specifying the actual directory path to the secure browser, and the desired proxy options along with an “&’ at the end of the line.
   
   **(In Terminal, enter the appropriate command lines as shown below, pressing [Enter] after each command line (where you see an extra line space, that is where you press [Enter]. Use the appropriate proxy command in the second command line.)**

   Mac 10.4 and 10.5 commands (PPC):
   ```bash
   #!/bin/sh
   /Applications/SBACSecureBrowser5.5.app/Contents/MacOS/.kiosk-bin -proxy 1:http:foo.com:80 &
   ```
Mac 10.5 commands (Intel):
```
#!/bin/sh  (press Enter)

arch -i386
/Applications/SBACSecureBrowser6.1.app/Contents/MacOS/
SBACSecureBrowser6.1 -proxy 1:http:foo.com:80 &
```

Mac 10.6–10.8 commands:
```
#!/bin/sh  (press Enter)

/Applications/ SBACSecureBrowser6.1.app/Contents/MacOS/./
SBACSecureBrowser6.1 -proxy 1:http:foo.com:80 &
```

Mac 10.4 and 10.5 PPC command sample

4. Save the file and exit the editor by pressing [Ctrl-O], [Enter], and then [Ctrl-X].
   *Note: Terminal will look like this:

5. Execute permission to the shell script file. (In Terminal, type in the command line below and then press [Enter].)
   ```bash
   chmod a+x securebrowser.command
   ```

6. Close Terminal.

7. Click the [securebrowser.command] icon on the desktop to open the secure browser with the desired proxy settings.
Linux (Fedora Core 6 and Ubuntu 9 and 10).
1. Right-click the desktop and select “Create Launcher.”
2. Enter an appropriate name for the shortcut.
3. Enter the full path of the SBACSecureBrowser6.0 proxy command and the additional options. 
4. Click [OK].

Linux (Ubuntu 11 and 12).
1. Right-click the secure browser desktop icon and select “Copy.”
2. Right-click the desktop and select “Paste.”
3. Right click the newly copied icon and select “Properties.”
4. Append the “-proxy 1:http:foo.com:80” option to the “Command:” field.
5. Click [Close].
Section VI. Mobile Secure Browsers

Introduction

The mobile secure browsers for iPad and Android tablets are designed to support a secure testing environment. These applications require changes to default tablet settings.

The first time a mobile secure browser is opened successfully, a “Launchpad” page will appear. This page will prompt you to select your state and the Smarter Balanced Secure Pilot Assessment. Once this step is completed, the student login page will load.

This document contains information about the installation and setup of mobile secure browsers. Information on test administration, creating and logging into test sessions, and navigating through the test is in the Test Administration Manual, which is available on the Smarter Balanced Secure Pilot Test portal in the Resources and Documentation section (http://sbac.portal.airast.org).

Supported Mobile Devices and Operating Systems:

1. Tablets must have a 10” class screen or larger.
2. Apple iOS 6.0 and above on iPad 2, 3, and Retina display
3. Android OS 4.0 and above on Google Nexus 10, Motorola Xoom, Motorola Xyborg, Samsung Galaxy Note (10.1), and Samsung Galaxy Tab 2 (10.1)

Secure Testing on iPads

To ensure a secure test environment, Guided Access must be enabled and activated before students can log in to a test session. Guided Access is an iOS feature that allows users to restrict activity to a single application and also prevents taking screenshots or changing to another application. Students will not be able to log in if Guided Access is not enabled and activated.

School technology staff and Test Administrators should all be familiar with Guided Access and ensure that they know how to activate Guided Access on all students’ iPads prior to a test session. Tas should also know the passcode for deactivating Guided Access after a test session ends.

In the event that Guided Access is deactivated while a student is testing (if the student knows the Guided Access passcode), the test environment will no longer be secure and the student will be logged out of the test.

This document contains instructions for enabling, activating, and deactivating Guided Access, as well as completing the Launchpad page steps.

Secure Testing on Android Tablets

The secure browsers for Android tablets require the secure browser keyboard to be selected before students can access the login page. The reason for this is that the default Android keyboard allows predictive text, which would unduly aid students when entering written responses to test items. The secure browser keyboard is a basic keyboard, with no row for predictive text functionality.

The first time you open the Android secure browser, you will be prompted to select the secure browser keyboard. Students cannot access the login page until the secure browser keyboard is selected.

This document contains instructions for opening the Android secure browser, selecting and enabling the secure browser keyboard, and completing the Launchpad page steps.
Android Secure Browser

The secure browser for online testing for supported Android tablets can be downloaded from the Google Play store. The process for installing the secure browser is the same as for any other application. The Android secure browser is supported on the following tablets running at least Android 4.0:

- Google Nexus 10
- Motorola Xoom
- Motorola Xyborg
- Samsung Galaxy Note (10.1)
- Samsung Galaxy Tab 2 (10.1)

Downloading and Installing the Android Secure Browser

1. On your Android tablet, click the following link. You will be taken to the AIR Secure Test application page.

   https://play.google.com/store/apps/details?id=com.air.mobilebrowser&feature=search_result#?t=W251bGwsMSwxLDEsImNvbS5haXIubW9iaWxlYnJvd3NlciJd

2. Tap or select the [Install] button.

3. The secure mobile browser will download and install onto your Android tablet. Look for the AIRSecureTest icon (the name may be truncated).
Opening the Android Secure Mobile Browser and Changing the Keyboard

The first time you open the Android Secure Mobile Browser, you will be prompted to select the secure browser keyboard.

Notes about the secure browser keyboard and general settings:

1. Once the secure browser keyboard is set, that becomes the default keyboard for all Android tablet applications, not just the secure browser. If you want to return to the default Android keyboard after using the secure browser, you will have to navigate to Settings > Language & Input and uncheck the secure browser keyboard.

2. If you change back to the default Android keyboard, you will be prompted to select the secure browser keyboard the next time you open the secure browser. The secure browser will not allow you to access the student login page until the secure browser keyboard has been selected.

Note: All screenshots in this section were taken with a Samsung Galaxy Tab 2.

1. Select the secure browser icon on the home screen.

2. You will be prompted to change the keyboard. Select [Close].

3. Select [Set up input methods]. The Language & Input settings screen will automatically open.

4. Select the checkbox next to “AIRSecureTest” so that a check mark appears.

   You will be prompted to acknowledge that this selection is okay. Select [OK] to continue.

   Note: This action allows the secure browser keyboard to be used by the secure browser application.
5. Navigate to the secure browser to open it. (You can use the application switcher or go back to “Home” and select the secure browser icon.)

You will be prompted to change the keyboard. Select [Close].

6. The Android tablet’s default keyboard will still be selected.

Select the checkmark or circle for the AIRSecureTest keyboard.

7. Select [Continue]. You will be prompted to complete the application launch using the preferred method.

8. Select AIRSecureTest (ensure it is shaded and highlighted blue) and then select [Always].

Note: You will have to acknowledge that the secure browser’s default settings have changed. (This is a result of selecting the secure browser keyboard.)

9. Select [OK].

The Launchpad will display. (See the next section for instructions.)
Opening the Android Secure Browser and Selecting the Assessment Program

1. The first time the secure browser successfully opens after selecting the correct keyboard, the Launchpad page will display.

   Under “Please Select Your State,” select the correct state from the drop-down list.

2. Under “Choose Your Assessment Program,” the Smarter Balanced Secure Pilot should already be selected.

3. Tap or select [OK]. The student login page will load.

   Note: The Launchpad is designed to display only one time. The student login page will display automatically the next time you open the secure browser.

Closing the Android Secure Browser

1. Tap the Menu icon [≡] in the upper right corner.

2. Tap [Exit]. A pop-up message will appear asking you to verify that you want to exit the secure browser.

3. Tap [Exit].
iPad Secure Browser

The secure browser for online testing for iPads can be downloaded from the App store. The process for installing the secure browser is the same as for any other application.

The iPad secure browser is supported on iPads 2 and newer running iOS 6.0. (The iPad mini is not supported.) The Guided Access feature must also be enabled.

**Downloading and Installing the iPad Secure Mobile Browser**

The secure browser for online testing for iPads can be downloaded from the App store. The process for installing the secure browser is the same as for any other application.

*Reminder: All iPads must be running at least iOS 6.0. Earlier versions are not supported.*

1. On your iPad, click the following link. You will be taken to the AIR Secure Test application download page.

2. Tap or select the [Free] button. The button will change to say [Install App].

3. Tap or select [Install App].

4. Enter your Apple ID password.

5. The secure mobile browser will download and install onto your iPad. Look for the AIRSecureTest icon.
Enabling Guided Access

1. Tap the [Settings] icon to open the Settings application.

2. Navigate to General > Accessibility > Learning and tap [Guided Access].

4. Set the passcode for Guided Access. This passcode is required to deactivate Guided Access after students are done testing. (If you do not set the passcode now, you will be prompted to set it later.) To set the passcode:
   1. Tap [Set Passcode].
   2. Enter a 4-digit passcode.
   3. Confirm the 4-digit passcode. (You may want to write down or save this number in a safe place. There is no ability to “retrieve” a forgotten passcode.)
Opening the iPad Secure Browser and Selecting the Assessment Program

The first time you open the iPad Secure Mobile Browser, you will see a “Launchpad” page. This Launchpad establishes the test administration your students will log in to.

1. Under “Please Select Your State,” select the correct state from the drop-down list.

2. Under “Choose Your Assessment Program,” the Smarter Balanced Secure Pilot should already be selected.

3. Tap or select [OK]. The student login page will load.

Note: The Launchpad is designed to display only one time. The student login page will display automatically the next time you open the secure browser.
## Activating Guided Access Before a Test Session Begins

1. Open the Secure Browser app. The student login page should display.

2. Triple-click (press) the Home button at the bottom of the iPad.

3. The Guided Access options will appear in a border around the secure browser app.

   Tap the blue [Start] button in the upper right corner.

   A pop-up message will appear saying Guided Access has started.

   *Note: Disregard the options at the bottom of the screen. When Guided Access is activated, students cannot switch to any other applications or take screenshots.*
Deactivating Guided Access After a Test Session Ends

1. Triple-click (press) the Home button at the bottom of the iPad.

2. Enter your Guided Access passcode. This must be the same passcode that you selected when you enabled Guided Access.

3. Tap the gray [End] button in the upper left corner. A pop-up message will appear saying Guided Access has ended.

Closing the iPad Secure Browser

1. Double-click (press) the Home button at the bottom of the iPad. This will open the multitasking bar.

2. Press the minus sign on the [AIRSecureTest] icon until it disappears.
Section VII. Chromebooks

General Information about Chromebooks

AIR has worked with Google to develop a secure testing environment using Chromebooks. As a result, no secure browser is required to be installed on Chromebooks. Instead, students must log in to a Chromebook using a specific computer login profile.

Chromebooks require users to add a user account or “log in” as a guest. Thus, students who will be testing using Chromebooks must have user accounts added in order to log in. These user accounts are based on students’ first names and State-SSID information as displayed in TIDE.

The requirements for Smarter Balanced Chromebook student accounts are:

**Email:** The student’s State-SSID followed by @airtest.org; e.g., ST-123456789@airtest.org. *Note: This field is case-sensitive (e.g., the state abbreviation should be capitalized).*

**Password:** The student’s first name (in all lowercase letters; e.g., jane). This must be the first name that appears in TIDE, not a nickname or alternate spelling.

Availability of Secure Chromebook Logins

AIR is working with Google to configure Chromebook login profiles for all students who are added to TIDE for the Pilot Test. This process will take a minimum of one business day and may take longer. If you plan to begin student testing using Chromebooks within a few days of when the students were added to TIDE, please contact the Smarter Balanced Help Desk so that we can expedite creating Chromebook accounts for your students.

Adding a Student User Account to a Chromebook

*Note: Multiple student accounts can be added to a single Chromebook. However, care should be taken to ensure that students log into the correct user account (especially if two or more students share the same first name).*

1. When you turn on the Chromebook, you will see the operating system login screen. In the bottom row, click the [+Add User] link. The Add User window will appear.
2. In the Email field, enter the student’s State-SSID followed by @airtest.org; e.g., ST-123456789@airtest.org.
3. In the Password field, enter the first name for the selected student in all lowercase letters.
4. Click [Sign In]. A screen will appear that says “Welcome to your new account.”
5. Scroll down to the bottom of this screen and click [I accept. Continue to my account.]
6. Select a picture for the account and click [OK].
   a. Typically, after this step, new account users see a Google “Welcome” screen. Instead of this screen, the following message will appear: "Unable to access the network." **This is NOT an error.** This is by design because the email address entered in step 2 activates the profile type that restricts access to the Chrome Web Store, other applications, etc. The message that appears is Google’s default message.
7. Click [X] to close the “Unable to access the network” message. You will be directed to the Chromebook desktop.
Accessing the Chrome Web Browser and the Student Testing Site for the First Time
1. Click the Chrome browser icon in the lower left corner. The browser will open.
2. Click the Home icon next to the URL bar (it looks like a house).
3. The Student Testing Site login page will open automatically.

Security Information
1. If you try to open a new tab to conduct a web search or access another website, you will not be able to do so. A message will appear that says “Unable to access the network.”
2. If you try to access the Web Store, you will be unable to do so. You will get a message that says “Chrome Web store: The app is currently unreachable.”

Subsequent Logins
For a student whose account is already available on Chromebooks:
1. In the “Enter password” text box, enter the student’s first name (in lowercase letters) and click [Enter].

Upon login, the Chrome web browser will open automatically in full-screen mode and display the student login page.

Closing the Chrome Web Browser
1. Click the [X] in the tab.

About Managed Chromebooks
Managed Chromebooks have sign-in restrictions enabled. If students are using managed Chromebooks, your Chromebook administrator will need to authorize the secure domain.
1. As the Chromebook administrator, log into your Chrome OS management console.
2. Click the [Settings] tab.
3. Click the [Device Settings] tab and scroll down to the Sign-in Restriction section.
4. In the text box, enter the following text: *.airtest.org
5. Press [Enter].
Section VIII. About the Text-to-Speech Accommodation and Voice Packs

The text-to-speech accommodation requires voice packs to be pre-installed on computers that will be used for testing. For Windows and Mac operating systems, default voice packs are typically pre-installed. For computers running Linux Fedora Core 6 (K12LTSP 4.2+) or Ubuntu 9–12, voice packs may need to be downloaded and installed.

A number of voice packs are available commercially, and AIR researches and tests voice packs for compatibility with the secure browsers. Additionally, not all voice packs that come pre-installed with Windows and Mac operating systems are approved, as the quality of some default voice packs is not optimal for testing. The voice packs listed at the end of this document have been tested and approved for use with the secure browser.

Using the Text-to-Speech Accommodation

The text-to-speech accommodation is only available for the pilot tests; it is not available for the training tests. Text-to-Speech is currently available with the Windows, Mac, Linux, and Android secure browsers. It is also available when using Chromebooks.

We strongly encourage users to test the text-to-speech settings before students take the Pilot Test assessments. You can check these settings from the diagnostic page. From the Smarter Balanced portal Pilot Test page, click the [Diagnostic Tools] button, and then click the [Text-to-Speech Check] button.

How the Secure Browsers Work

The secure browsers are configured to recognize several known voice packs to provide the text-to-speech accommodation. The secure browsers detect pre-installed voice packs on the students’ machines. When a student with the text-to-speech accommodation logs into a test session and has been approved for testing, the secure browser will look for voice packs on the student’s machine. When it recognizes an approved voice pack, the one with the highest priority rating will be used to administer the accommodation. Note: If any of the approved voice packs has also been set as the default voice on the computer, then that voice pack will always get the highest priority.
Windows: Configuring Text-to-Speech Settings

This section provides information on ensuring that text-to-speech accommodation for online testing will work appropriately on computers running Windows XP (Service Pack 3), Vista, 7, or 8.

The speech feature on Windows operating systems is user interface (UI) driven. This means that the text-to-speech preferences used to administer the text-to-speech accommodation are located within the computer’s system preferences. Follow the steps below to configure text-to-speech preferences.

As a reminder, the text-to-speech accommodation is available only when the secure browser is used. Students can access the Training Test using the secure browser.

Note: The instructions in this section are for computers running Microsoft Windows XP. The process is similar for other Windows operating systems.

**Step 1: Access Control Panel**

Click the [Start] button and then click the Control Panel link.
Step 2: **Access Speech Options**

In the Control Panel window, click the [Speech] icon. This will bring up the Speech properties window.

![Speech Properties Window]

Step 3: **Set Speech Preferences**

1. Select your desired **Voice Selection** from the drop-down menu. (You may have only one voice available.)
2. Click [Preview Voice] to verify that you can hear the voice.
3. Set the desired Voice speed. Click [Audio Output] to listen to the settings. You can adjust the settings as desired.
4. When you are done, click [OK] to save your settings, and then click the Red [X] at the top right of the screen to close the window.
Mac OS X: Configuring Text-to-Speech Settings

This section provides information on ensuring that the text-to-speech accommodation for online testing will work appropriately on computers running Mac OS X 10.4–10.8.

The speech on Mac operating systems are user interface (UI) driven. This means that the text-to-speech preferences used to administer the text-to-speech accommodation are located within the computer’s system preferences. Follow the steps below to configure audio preferences to enable the text-to-speech accommodation.

As a reminder, the text-to-speech accommodation is available only when the secure browser is used. Students can access the Student Practice Test using the secure browser. The text-to-speech accommodation is not supported for Firefox web browsers.

*Note: The instructions in this section are for computers running Mac 10.6. The process is similar for other Mac operating systems.*

**Step 1: Access System Preferences**

Click the Apple icon and then click “System Preferences.”

**Step 2: Access Speech Options.**

In the System Preferences screen, click the [Speech] icon. (This icon typically appears in the “System” row.)
Step 3:  Set Speech Preferences.

1. Make sure the [Text to Speech] tab is active (it should be blue). You may need to click it to view this screen.

2. Select your desired System Voice from the drop-down menu.

3. Set the desired Speaking Rate. Click [Play] to listen to the settings. You can adjust the settings as desired. Note: The speaking rate selected applies to all voices installed on the system.

4. When you are done, click the red [X] at the top left of the screen to save your preferences and close the window.
Linux: Enabling Text-to-Speech and Default Settings

This section provides information for Technology Coordinators on how to ensure that the text-to-speech accommodation for online testing will work appropriately on computers running Linux Fedora Core 6 (K12LTSP 4.2+) or Linux Ubuntu 9–12.

Linux is a modular kernel operating system, which means that specific non-used kernel modules may not load when the system is booted up. *If the required kernel modules are not already built in or installed*, this document will not provide you with the information that you need.

Other Software

In addition to downloading the Linux secure browser, you will also need to download two software programs: Festival and Sound eXchange (SoX). These programs will ensure that students can hear the audio in the online tests.

- To download Festival, click here: [http://www.cstr.ed.ac.uk/projects/festival/](http://www.cstr.ed.ac.uk/projects/festival/). Instructions for ensuring that Festival works properly are included in this document section.
- To download SoX, click here: [http://sox.sourceforge.net](http://sox.sourceforge.net). This website also contains information on installing and configuring SoX.

Important: The commands provided in this section require you to be logged in as “root.”

About Sound Cards and ALSA Drivers

You can determine what kind of sound card is configured on your Linux system. These file types typically are as follows:

- `/dev/dsp`
- `/dev/dsp1` or `/dev/dsp2` or `/dev/dsp3`, and so on
- `/dev/snd`
- `/dev/asound.conf`

The first three types are device files. You cannot read from or write to these files. However, if you have a MIDI file, you can use that to directly test the sound card. Use the following string to write the MIDI file to your computer’s sound card:

```
cat [MIDI file name] > /dev/dsp
```

Linux provides two tools to configure your sound card:

- system-config-soundcard (UI tool)
- alsamixer (text-mode tool)

This document provides instructions using the system-config-soundcard tool. If you choose to use alsamixer to configure your sound card, the steps are very similar.
Checking Sound on Your Computer

If you discover that audio is not working properly on your system, follow the steps in this section.

Step 1: Verify that your audio playback devices—e.g., headphones and/or speakers—are connected properly to the sound card. The green jack should always be plugged in to the green port or a port marked with a headphone icon 🎧.

Step 2: Check whether /dev/snd exists on your computer.

In the command prompt, enter the following command: `ls -la/dev/snd`

- If this does not exist, continue to **Step 3**.
- If this does exist, skip to **Step 5**.

Step 3: If /dev/snd does not exist, it is possible that the ALSA audio drivers were not installed or loaded properly when the system booted up.

In the command prompt, enter the following command: `modprobe snd-seq`

This command should run without any errors.

Step 4: Check whether /dev/snd exists on your computer.

In the command prompt, enter the following: `ls -la/dev/snd`

If this exists, then use Secure Browser to go to the Diagnostics page and check whether the audio works.

- If the audio playback works **without any errors or issues**, skip to **Step 7**.
- If the audio playback **has errors or issues**, continue to **Step 5**.

If you still cannot find /dev/snd on your computer, please consult your system administrator for assistance. **Do not continue with the instructions in this document.**
Step 5: At the command prompt, enter: \texttt{system-config-soundcard}

This will display a graphic user interface that you can use to fix sound card problems.

\textit{Sound card configuration user interface}

6. In the \textit{Sound Test} tab, click the Play \[ \text{Play} \] button.
   - If you hear audio, then your sound card is working correctly. Continue to #3.
   - If you did not hear audio, continue to #2 below.

2. Click the \textit{System} tab.
   - Click \textbf{[Relode Audio Drivers]} (this step will reinitialize the drivers)
   - Click the \textit{Sound Test} tab and click the Play \[ \text{Play} \] button again.
     - If you hear the audio, then your sound card is now working correctly.
     - If the audio is still not working, consult your system administrator for assistance. Do not continue with the instructions in this document.

3. Click the \textit{Settings} tab.

   In the section called “Audio Cards Indexer,” look at the first and second columns. The first column is the Index column and contains a number (e.g., 0 or 1). The second column is the name of the sound card installed at the index.

\textit{Note the index number in the first column, and continue to Step 6.}
Step 6: If the index number in Step 5, #3, is 0, then your computer should have a /dev/dsp sound file. Try the audio playback on the secure browser again.

If the index number in Step 5, #3, is anything other than 0, you need to create a link from the index file to the /dev/dsp file.

Open the command prompt and type the following command:

```
ln -s /dev/dsp[index] /dev/dsp (where [index] is the index number)
```

Try the audio playback on the secure browser again.
Testing Festival for Use with the Text-to-Speech Accommodation

By default, Linux operating systems use Festival for speech synthesis. Be sure that you have already downloaded and installed Festival appropriately before completing the following steps. These steps will determine whether Festival is configured correctly to work with the text-to-speech accommodation. (Festival can be downloaded here: http://www.cstr.ed.ac.uk/projects/festival/.)

**Step 1:** At command prompt, type `festival`. The Festival command line will display on the next row. Enter the following: `(SayText “hello”), and press [Enter].

*If you hear the word “hello” being spoken, then Festival is installed properly.*

**Step 2:** In the next Festival command prompt, type the command `libdir` and press [Enter]. The output will display the path name where Festival is installed. For example:

```
/usr/share/festival
```

Make a note of this path name. Navigate to this directory path and look for the file named “audsp.”

*Note: If this file is not found, then there may be an issue with your Festival installation. If that is the case, do not continue with the instructions in this document until you resolve the installation issue.*

**Step 3:** The file “audsp” needs to be added to the list of folders where the operating system searches for executables and other necessary files. It is identified by a system variable called PATH. To view the current list, type the following into the command prompt:

```
echo $PATH.
```

You will also need to run the following command to ensure that the audsp file is easily found:

```
ln –s <audsp path> /bin/audsp
```

Replace the `<audsp path>` with your computer’s path to audsp displayed in Step 2. For example, if `audsp` is located in

```
/usr/share/festival/etc/unknown_RedHatLinux/
```

then the full command prompt should be:

```
ln –s /usr/share/festival/etc/unknown_RedHatLinux/audsp /bin/audsp
```

This step creates a symbolic link to the `audsp` file found in the Festival installation directory from any folder that is known to be on the path. (In this case, `/bin` was the primary path.) You may choose any other folder as long as it is known to be a common path for all users.
Setting Defaults for Voice, Reading Speed, and Volume

This section provides an overview of how to change the default settings in Festival. These instructions assume that you have already downloaded and installed the requisite voice packs.

Changing the default settings as described in each section will change the settings for all users.

Default Voice Settings

Step 1: In the command prompt, enter `festival`, and then execute the following commands exactly as shown:

```
festival>libdir
"/usr/share/festival" (Note: This output line may be different)

festival>(voice.list)
(cepstral_miguel
 cepstral_miguel
 cmu_us_slt_arctic_hts
 cmu_us_bdl_arctic_hts
 cmu_us_awb_arctic_hts
 ked_diphone
 kal_diphone)

festival>voice_default
ked_diphone
```

Note: The outputs for the commands `libdir`, `voice.list`, and `voice_default` may be different based on your installation.

Step 2: Make a note of the output for the command “libdir” in the step above. Change to that directory. (In our installation, it is `/usr/share/festival`.)

Step 3: Open the file `init.scm` for editing.

Step 4: Select any voice from the `voice.list` output in Step 1. To set up your selection as the default voice, use the following commands:

```
(set! Voice_default 'voice_<voice name from the list>)
```

If you chose “cmu_us_slt_arctic_hts,” this line would look like:

```
(set! Voice_default 'voice_cmu_us_slt_arctic_hts)
```
Default Reading Speed

Depending on the specific needs of the individual students who will use the text-to-speech accommodation, a slower reading speed may be desirable. This also has the effect of making the voice sound deeper.

Step 1: Open the file init.scm for editing.
To locate the file, follow steps 1 and step 2 from the Default Voice Settings section.

Step 2: Append the following line to the end of init.scm.

```
(Parameter.set ‘Duration_Stretch <number>)
```

Acceptable values are any number greater than 1. However, experiments have shown that numbers higher than 2 are too slow.

For example, if a slower reading speed is desired, then you can set <number> to 1.5 or 2.0.

Default Volume Setting

A default volume may be set by running system-config-soundcard or alsamixer from the command prompt.
**Voice Packs Recognized by Secure Browser**

The tables in this section display the voice packs for each operating system (Windows, Mac and Linux) that are currently recognized by the secure browser.

Windows and Mac OS X computers typically ship with at least one default voice pack. Many of these default voice packs are recognized by the secure browser.

**Windows XP, Vista, 7, 8**

User Support

If this document does not answer your questions, please contact the Smarter Balanced Help Desk at the American Institutes for Research.

Smarter Balanced Help Desk
Customer Support Phone: 1-866-815-7246
Customer Support Email: SmarterBalancedHelpDesk@air.org

E-mails to the Help Desk will be automatically logged and answered within one working day (typically sooner). Urgent requests will be given priority.

If you contact the Help Desk, you will be asked to provide as much detail as possible about the issue(s) you encountered.

Please always include the following information:
1. Test Administrator name and IT/network contact person and contact information
2. SSID number(s) of affected student(s)
3. Results ID for the affected student test(s)
4. Operating system and browser version information
5. Any error messages and codes that appeared, if applicable
6. Information about your network configuration:
   • Secure browser installation (to individual machines or network)
   • Wired or wireless Internet network setup

Supported Operating Systems

As a reminder, AIR provides official technical support only for the following systems that are used for student testing and related applications:

- Windows XP (Service Pack 3), Vista, 7, 8
  - Ncomputing (Windows XP)
- Windows Server 2003 and 2008
  - Terminal Services
- Mac OS X (10.4, 10.5, 10.6, 10.7, 10.8)
- Linux Fedora Core 6 (K12LTSP 4.2+) and Ubuntu 9–12
- iOS 6.0 and above
- Android 4.0 and above
## Change Log

This table provides an overview of updates to the manual that were made since its original publication.

<table>

<tr>
<th>Page</th>
<th>Section</th>
<th>Change</th>
<th>Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>35</td>
<td>Enabling Java on Mac OS 10.7 and 10.8 Computers</td>
<td>Added note clarifying that Java is required to run network diagnostics, not the tests</td>
<td>2/15/2013</td>
</tr>
</tbody>
</table>
| 38   | Android Secure Browser | • Added Motorola Xyborg and Samsung Galaxy Note (10.1) as supported tablets  
• Changed release of information to late February | 2/15/2013 |
| 39   | iPad Secure Browser | • Changed release of information to late February  
• Added steps for enabling Passcode to the Guided Access section | 2/15/2013 |
| 40–41| Chromebooks | Added instructions for accessing the secure testing environment using Chromebooks | 2/15/2013 |
| 53   | Using the Text-to-Speech Accommodation | Clarified that TTS is available only for the pilot tests, not the training tests  
Updated supported operating systems | 2/15/2013 |
| 13   | Network Configuration (Firewall, content filter, and proxy servers) | Updated IP addresses for the following:  
• Common Login System  
• TA Interface and Student Testing Site  
• Online Reporting System | 3/1/2013 |
| 15-16| Hardware Requirements | • Clarified screen display requirements to indicate that iPads are part of the 10” class  
• Updated Keyboard information | 3/1/2013 |
| 48   | Secure browsers and proxy settings | Added sample 64-bit path for creating a Microsoft Windows desktop shortcut | 3/1/2013 |
| 50–59| Section VI, Mobile Secure Browsers | • Created separate Mobile Secure Browsers section  
• Moved Android and iPad sections into this section  
• Added Android and iPad installation and setup instructions | 3/1/2013 |
| 60–61| Section VII, Chromebooks | • Chromebooks information is now in its own section  
• Updated information about availability of Chromebook logins | 3/1/2013 |
| 64   | Section VIII, About the Text-to-Speech Accommodation and Voice Packs | With the creation of Sections VI and VII, this is now Section VIII | 3/1/2013 |
| 50–59| Section VI, Mobile Secure Browsers | The secure mobile browser icon was updated to say AIRSTest. Changes in this document reflect the naming change. | 3/15/2013 |
| 61   | Section VII, Chromebooks | Added information on how to enable the secure airtest.org domain on managed Chromebooks. | 3/15/2013 |
| 45–48| Secure browsers and proxy settings | Inserted missing space in “arch –i386” for Mac 10.5 proxy commands. | 4/30/2013 |
